Analysis

Stimulation

- ❑ **Easy designing of a FlexRay communication network**
 - ❑ Define a cluster with one or two channels and the ECU topology
 - ❑ Define the signal database
 - ❑ Define FlexRay specific frames and their properties
 - ❑ Define Tx/Rx Frame relations per ECU
 - ❑ Define static and dynamic schedule
 - ❑ Specify global and local FlexRay configuration parameters (e.g. cycle length, number of slots, slot duration, ...)
 - ❑ Minor changes to the architecture and communication schedule are possible without the need to completely reschedule
- ❑ **Support of FIBEX version 1.1.5, 1.2, and 2.0**
 - ❑ Consistency check for FIBEX format and FlexRay settings
- ❑ **Configuration management** based on Vector eASee or other configuration management systems

Analysis

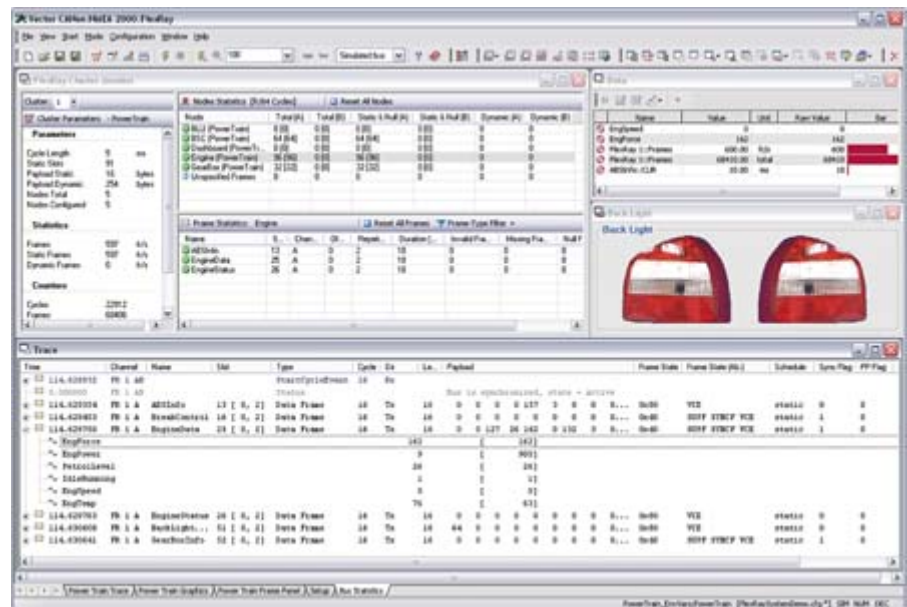

Stimulation

❑ Measurement and analysis

- ❑ Trace window for messages and bus events
- ❑ Data window
- ❑ Graphic window for plotting of signals
- ❑ Message statistic and bus statistic window
- ❑ Logging with triggers
- ❑ Filter
- ❑ Offline mode (replay of a log)
- ❑ GUI extensions for user friendly input and output using panel windows
- ❑ Import of network data definitions and network interface controller configuration from the FIBEX database

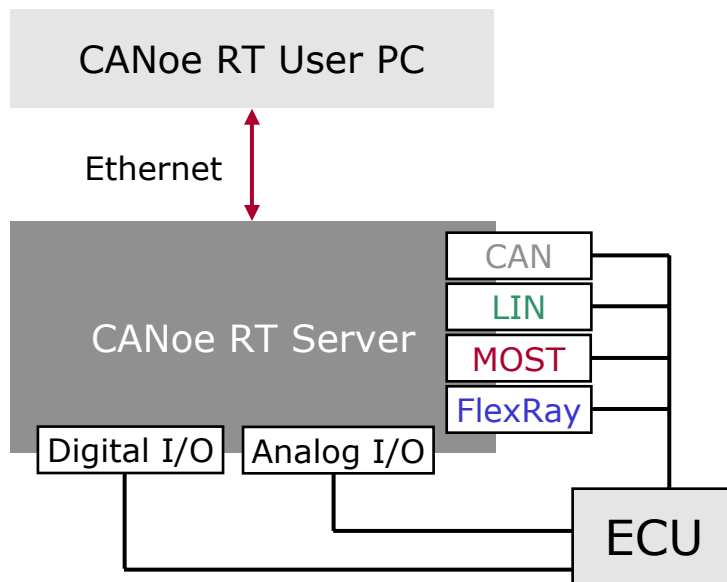

❑ Simulation, stimulation, and test

- ❑ CAPL modeling language
- ❑ Total bus simulation
- ❑ Remaining bus simulation
- ❑ Gateway functionality with CAN, LIN, MOST, FlexRay, J1587, etc.

CANoe RT System

- ❑ CANoe RT User PC
 - ❑ Front end for CANoe GUI
 - ❑ Host for logging data and test results
- ❑ CANoe RT Server
 - ❑ Real-time execution server for:
 - ❑ remaining-bus and environment simulation
 - ❑ test script execution

CANoe RT Server Platforms

Compact
Real-Time Box

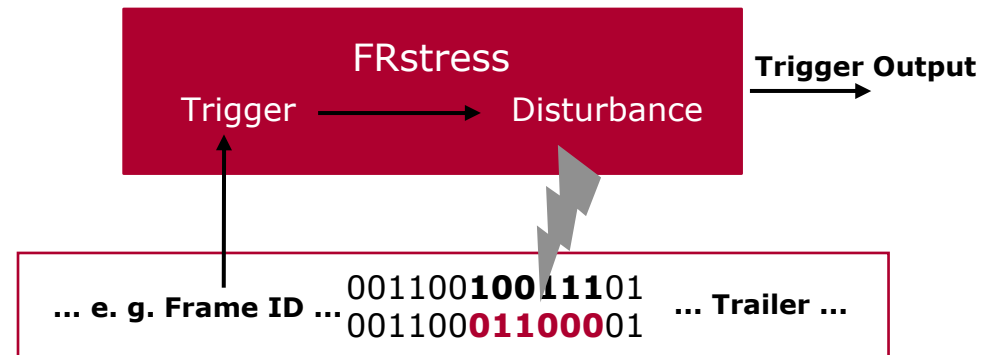

Real-Time Rack

Objectives:

- ❑ Identify network/ECU behavior caused by physical bus failures
- ❑ Identify network/ECU behavior caused by disturbing and manipulating FlexRay frames

Features:

- ❑ Triggering by specific values of frame fields or external trigger input and output
- ❑ Configuration of bit stream disturbances or manipulations
- ❑ Operation as: Normal node, star coupler, trigger engine

ECU Calibration

CANape

- ❑ Measurement and Calibration of ECU parameters
- ❑ Time-synchronous data acquisition and visualization of:
 - ❑ Internal ECU data
 - ❑ Signals from CAN, LIN, FlexRay bus
 - ❑ Signals from external measuring equipment
- ❑ Video and Audio measurement for verification of HMI devices or driver assistant systems
- ❑ Online calibration via CCP/XCP and real-time stimulation via XCP
- ❑ Offline calibration
- ❑ Seamlessly integrated diagnostics via KWP2000 and UDS

ECU Software

FlexRay Embedded Software Components

- ❑ Configuration by AUTOSAR ECU Configuration Description or FIBEX with GENy (included in DaVinci Configurator Pro)
- ❑ Operating system independent (OSEK, AUTOSAR SC1-4, or TT OS)
- ❑ All modules are available based on AUTOSAR 3.x
- ❑ Support of Development Error Tracer
- ❑ Support of Diagnostic Event Manager
- ❑ FlexRay Timer Services
- ❑ Cycle Multiplexing
- ❑ In-Cycle Repetition
- ❑ Rx and Tx Interrupt Mode
- ❑ Rx indication and timeouts, Tx confirmation
- ❑ Small and runtime efficient implementation
- ❑ Gateway function to CAN, LIN, FR realized through MICROSAR COM (PDUR, COM)

¹ Available extensions for AUTOSAR 3.0

² BAM and CMTD Option available

VN-Family and FlexCard

- ❑ FlexRay Controller: Bosch E-Ray
- ❑ Physical Layer Transceivers: NXP TJA1080
- ❑ Transmit and receive data and null frames
- ❑ Detect invalid frames
- ❑ Support cycle multiplexing, In-cycle response
- ❑ Support 254 byte maximum payload
- ❑ Autonomous network start
- ❑ Startup and asynchronous monitoring
- ❑ Time synchronization with Vector interfaces
- ❑ Configurable trigger output
- ❑ Driver library for own applications

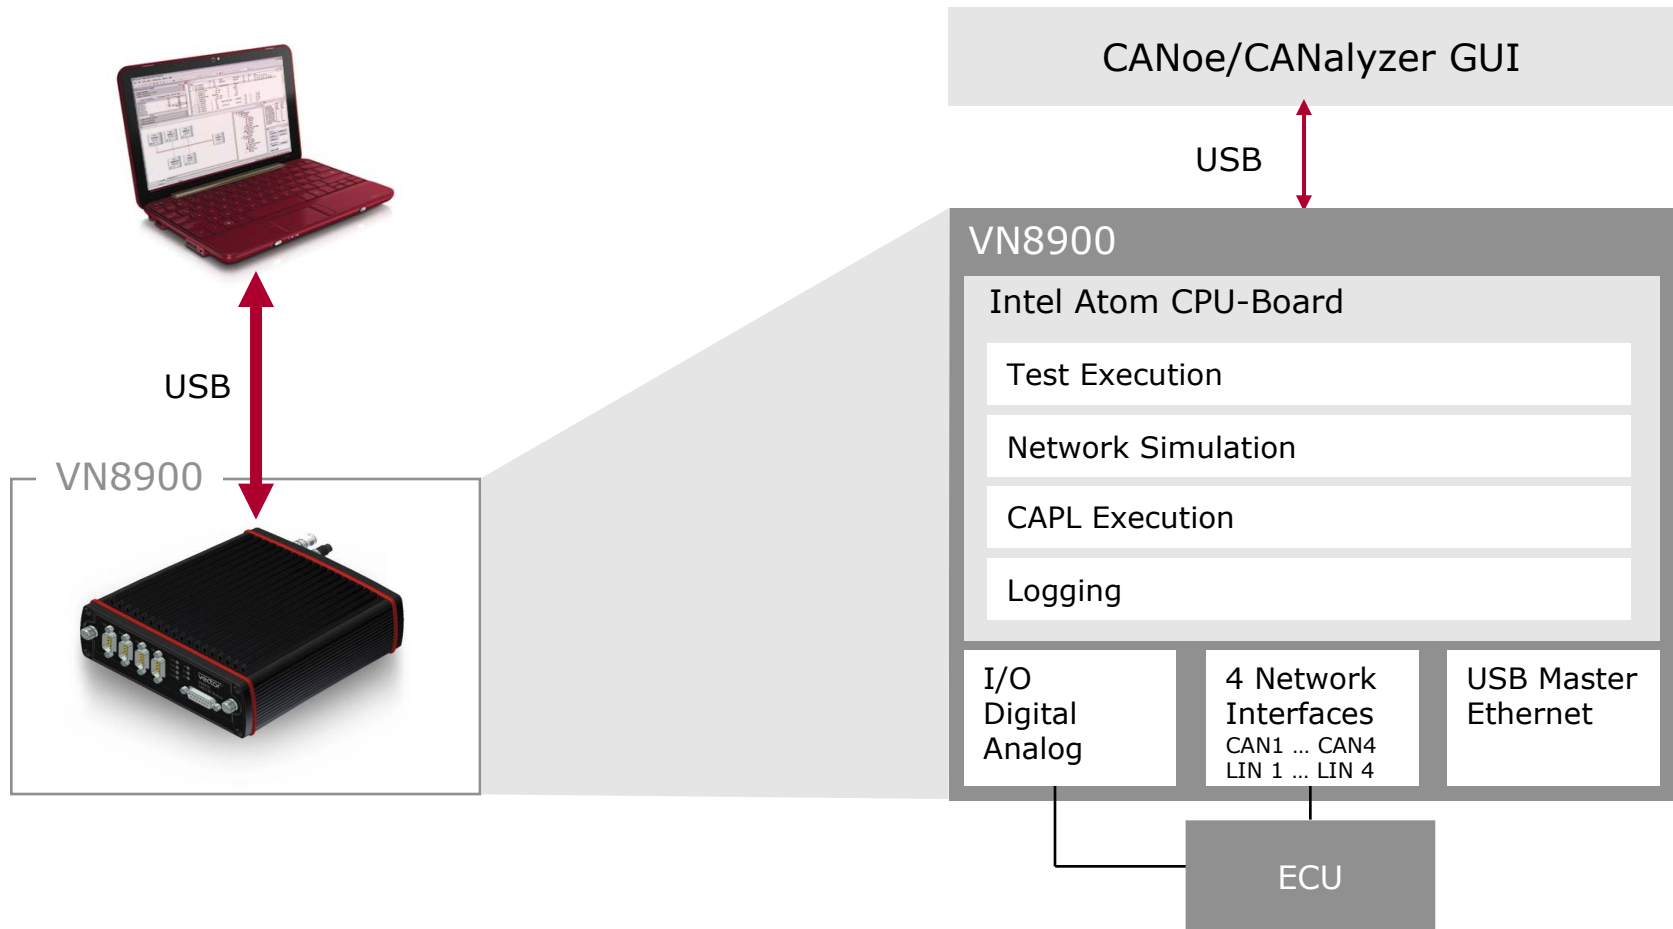

RT Server Platform as Extended CANoe Interface

- ❑ Typical use case:
CAN, LIN and FlexRay simulation with high real-time requirements
- ❑ Recommended for FlexRay simulations
- ❑ Dedicated interface for remaining bus and mid-size HIL simulations
- ❑ Deterministic execution platform for simulations
- ❑ Very small jitters
- ❑ Fast boot-up time (10 seconds)
- ❑ Ethernet connection to host PC running CANoe
- ❑ Competitive pricing due to the use of standard products
- ❑ Can be ordered as fully pre-configured system from Vector (including operating system)

FlexRay

Short Introduction

- FlexRay Solutions
- Design of Distributed Systems
- ECU Test, Simulation, and Analysis
- ECU Calibration
- ECU Software
- Network Interfaces
- Summary

> **FlexRay Main Characteristics**

- FlexRay Communication Structure
- Startup
- FIBEX Explorer
- PDU Support
- Analysis
- Stimulation

❑ Event driven

- ❑ System services are activated in response to events
- ❑ Serial bus system:
 - ❑ Bus access based on incoming events
 - ❑ Bus access if signal changes

❑ Time driven

- ❑ System services are activated at predefined times based on a (real-time) clock
- ❑ Serial bus system:
 - ❑ Bus access is periodic based on the schedule
 - ❑ No signal change := "Nullframe"

FlexRay Main Characteristics

Example: Personal transportation

❑ Event driven

- ❑ Individualized departure time
- ❑ Departure time and therefore trip duration unknown
- ❑ Trip might not even be completed

❑ Time driven

- ❑ Periodic departure time
- ❑ Departure time and trip duration known
- ❑ Reliable

FlexRay Communication Structure

Communication Cycle

❑ Data transmission with FlexRay:

- ❑ Time-driven, organized in cycles
- ❑ Cycle time is constant – Global clock
- ❑ Cycles are subdivided into segments
- ❑ Segments repeat themselves at equidistant time intervals

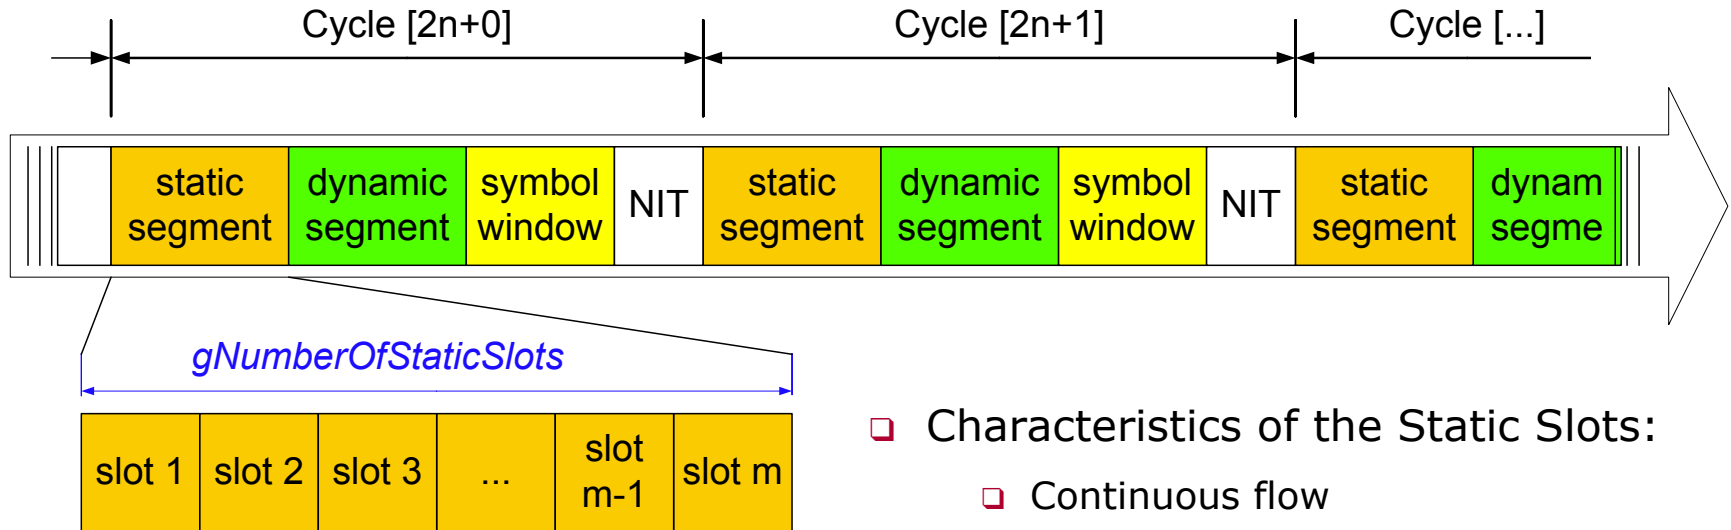

❑ Communication Cycle consists of:

- ❑ Static Segment
- ❑ Dynamic Segment (optional)
- ❑ Symbol Window (optional)
- ❑ NIT: Network Idle Time

PS 2.1: $cCycleCountMax := 63$

FlexRay Communication Structure

Static Slots

❑ Static Segment:

- ❑ TDMA bus access
- ❑ Deterministic time behavior
- ❑ Time window for real-time applications & safety-critical applications

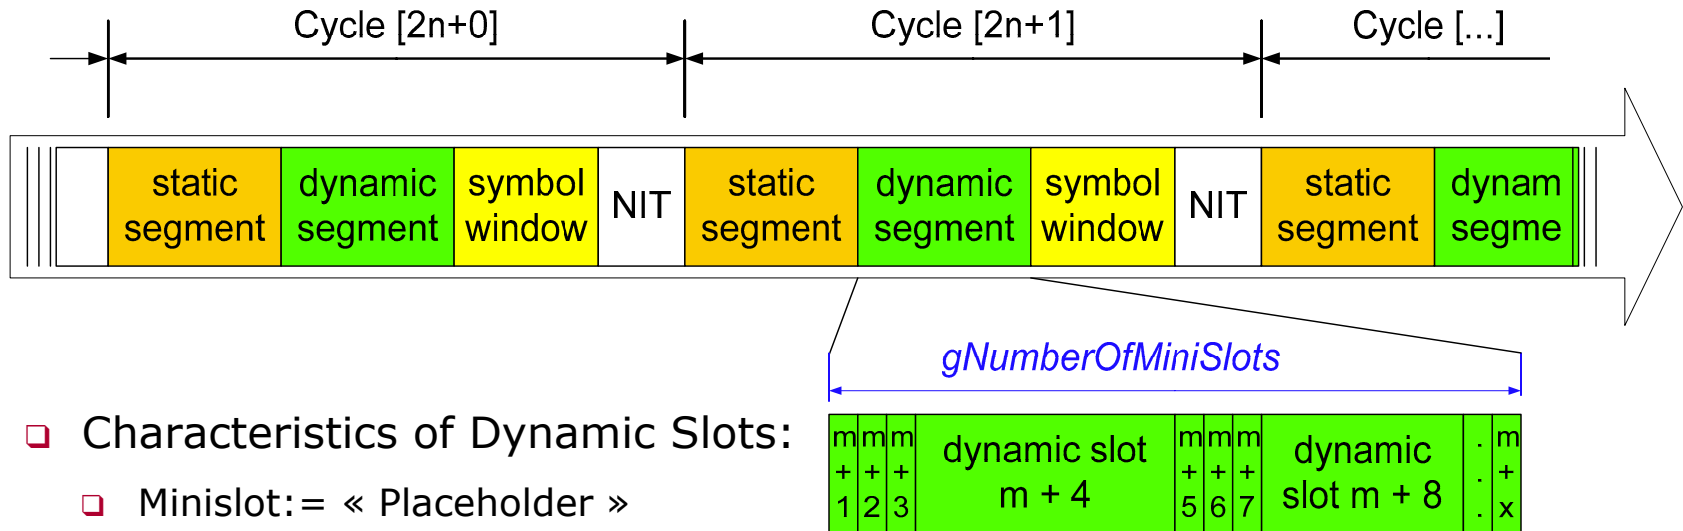

❑ Characteristics of the Static Slots:

- ❑ Continuous flow
- ❑ All static slots have same length
- ❑ Same number of slots in each cycle: *gNumberOfStaticSlots*
- ❑ Only one node may send per slot
- ❑ Slot IDs have unique assignments to TX nodes
- ❑ At least 2 static slots necessary for synchronization

PS 2.1: *cStaticSlotIDMax* := 1023

FlexRay Communication Structure

Dynamic Slots

Characteristics of Dynamic Slots:

- Minislot: = « Placeholder »
- Dynamic Slot IDs are allocated to TX nodes
- Same number of MiniSlots in each cycle: *gNumberOfMiniSlots*
- Transmission as needed, then Minislot becomes a dynamic slot
- Dynamic slots can have different lengths

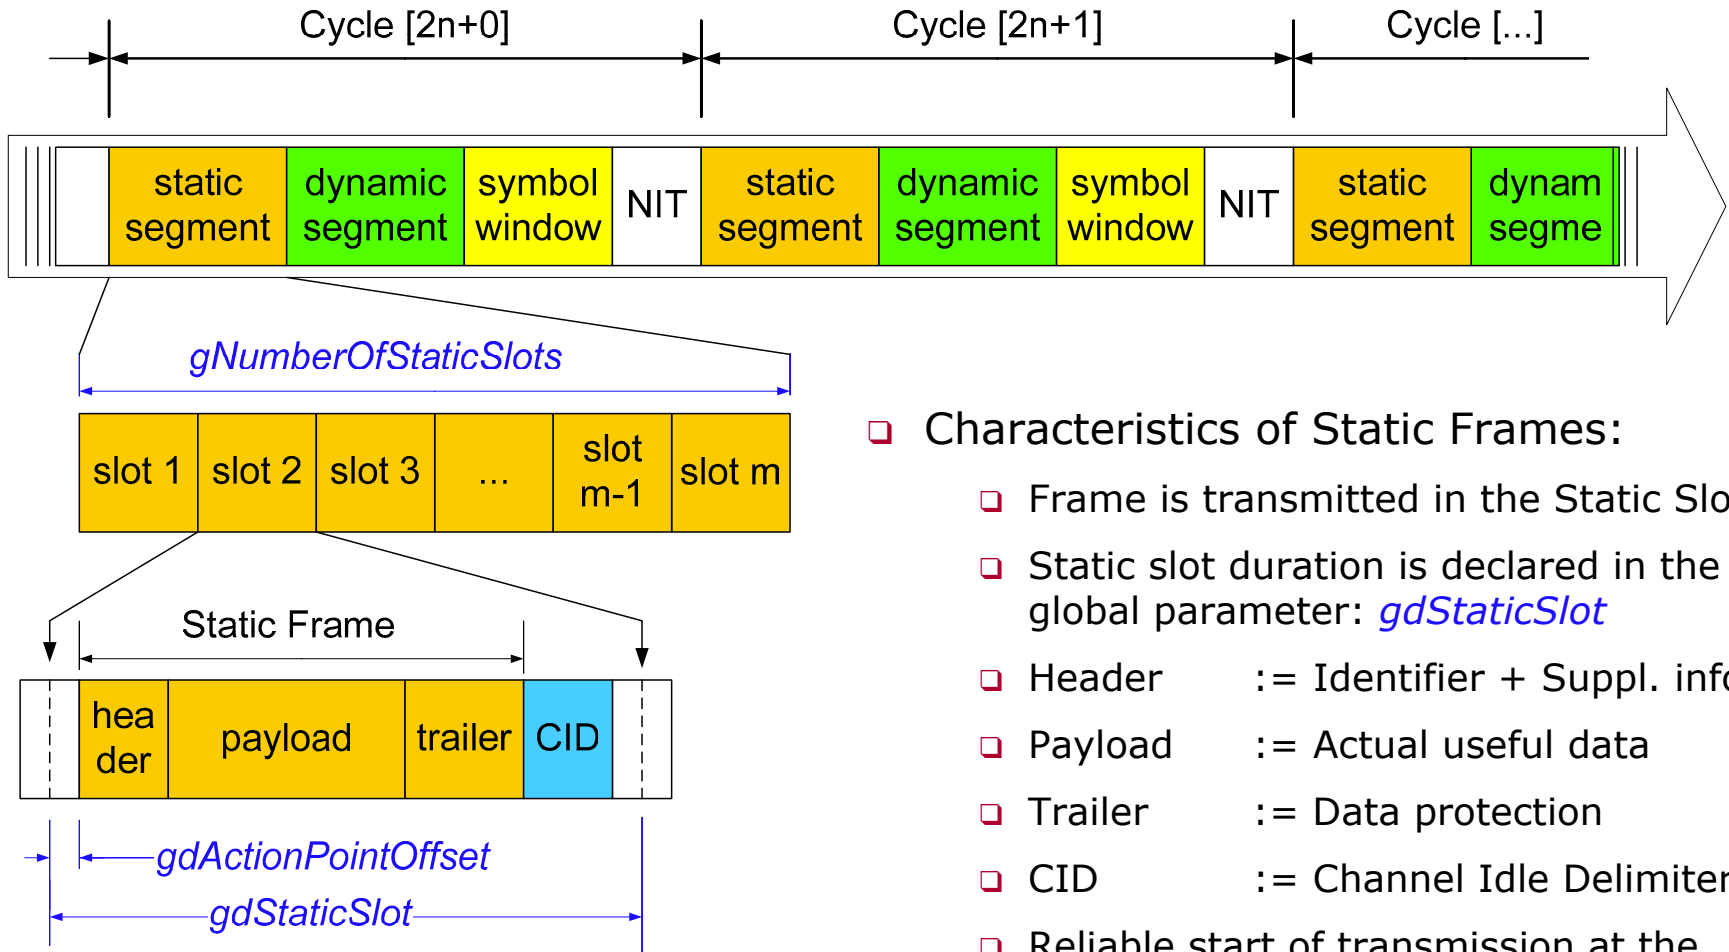

Dynamic Segment:

- FTDMA bus access
- « Arbitration » based on the Minislot ID
- Time window for event-driven data transfer

PS 2.1: *cSlotIDMax* := 2047

FlexRay Communication Structure

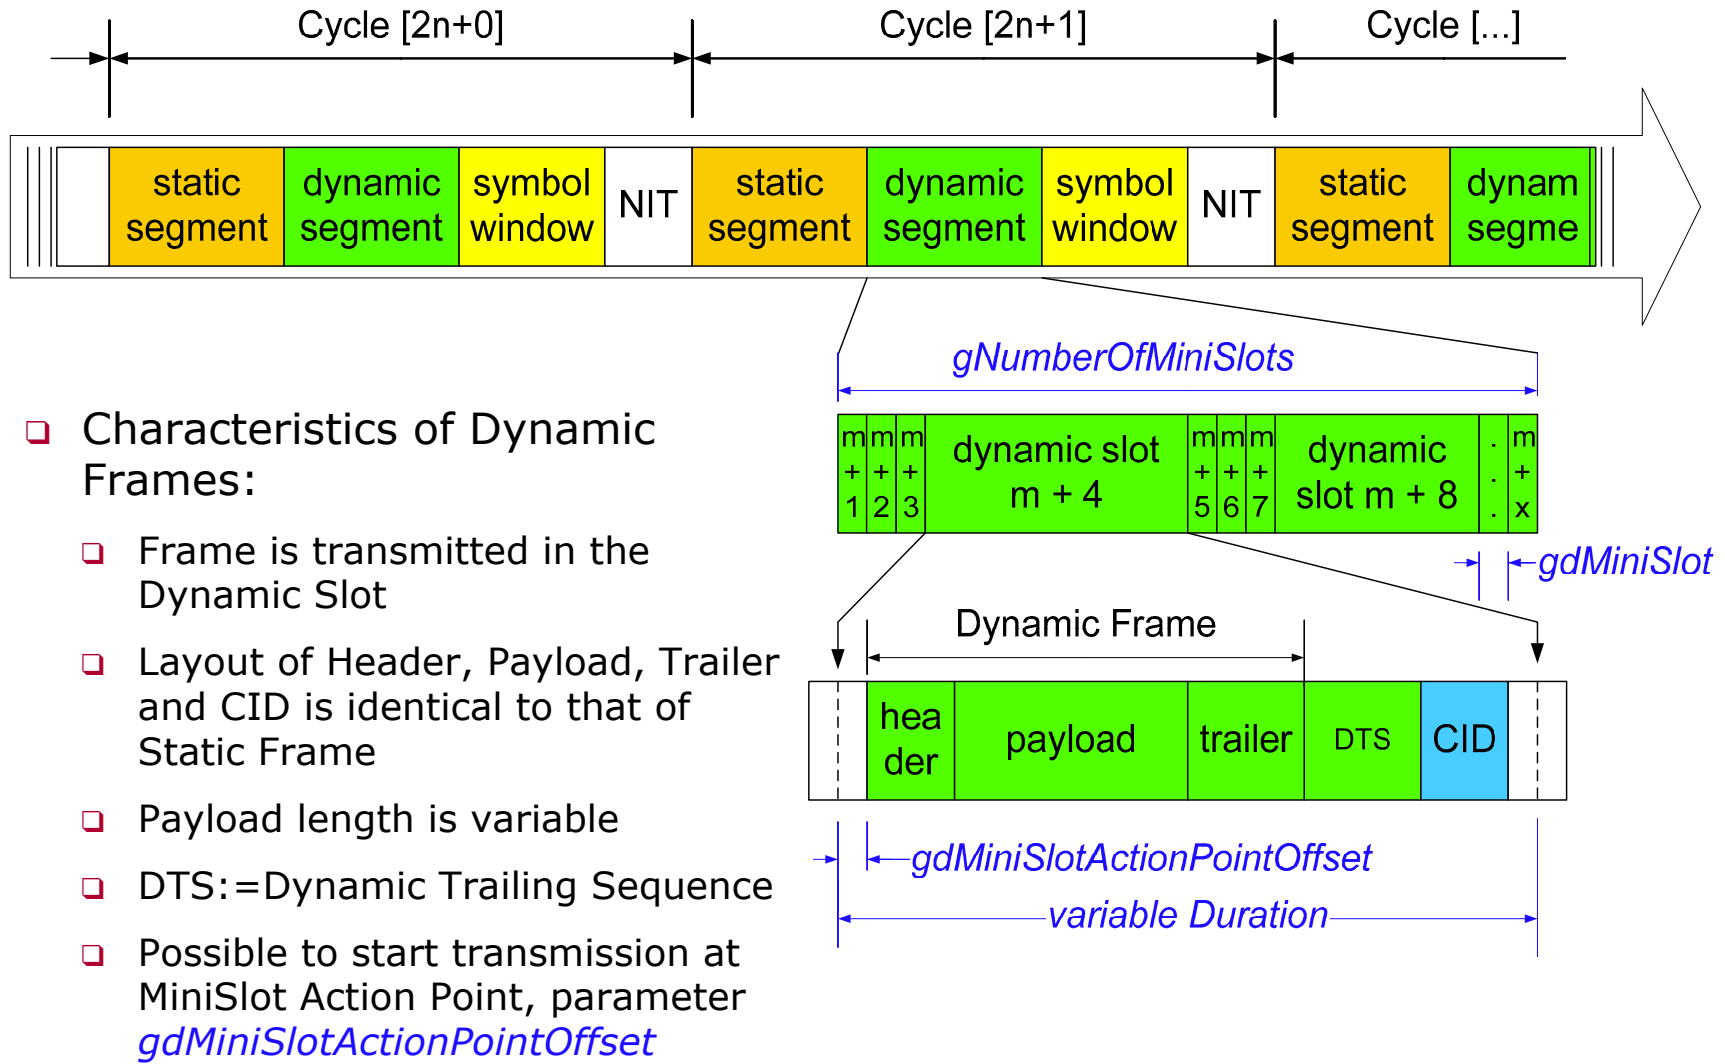

Static Frames

□ Characteristics of Static Frames:

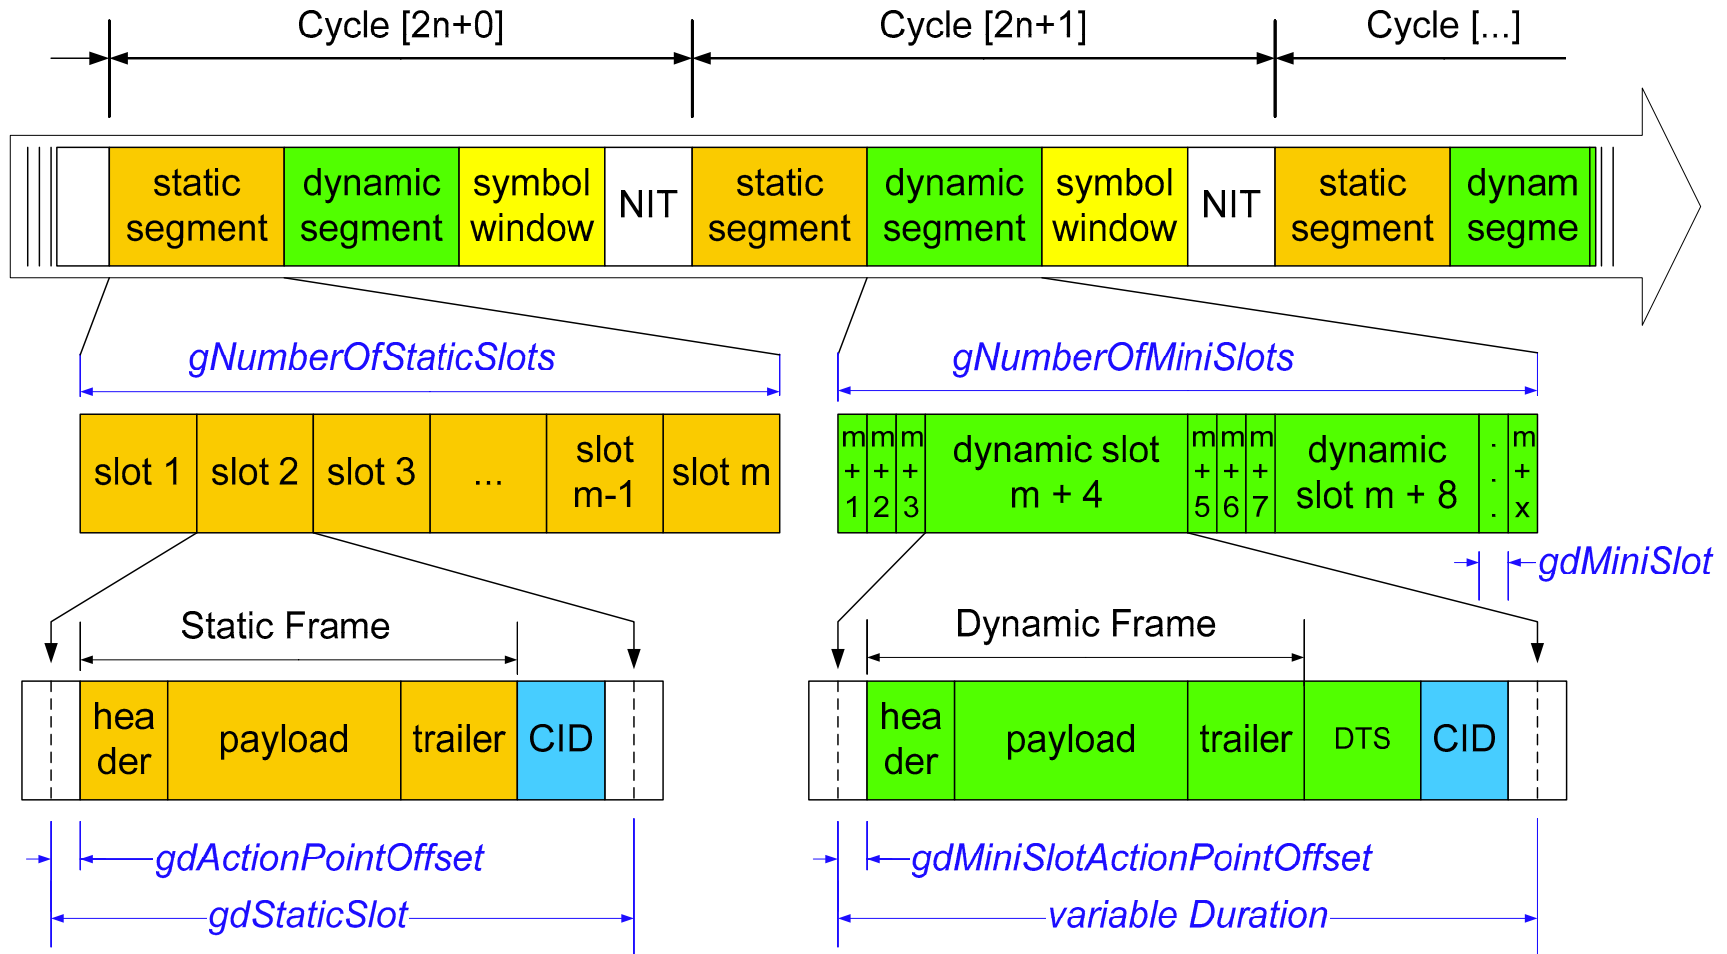

- Frame is transmitted in the Static Slot
- Static slot duration is declared in the global parameter: *gdStaticSlot*
- Header := Identifier + Suppl. info
- Payload := Actual useful data
- Trailer := Data protection
- CID := Channel Idle Delimiter
- Reliable start of transmission at the Action Point, global parameter *gdActionPointOffset*

Dynamic Frames

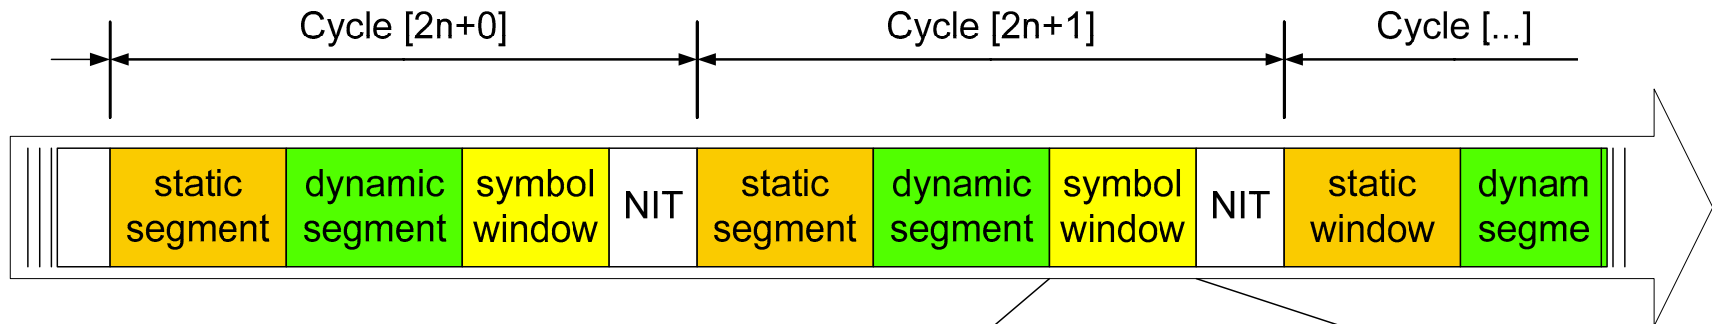

FlexRay Communication Structure

Overview: Static - Dynamic

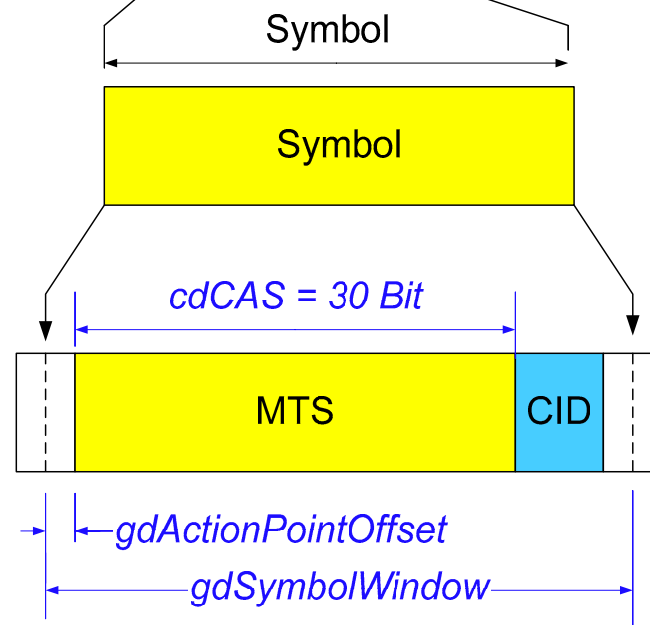

FlexRay Communication Structure

Symbol Window

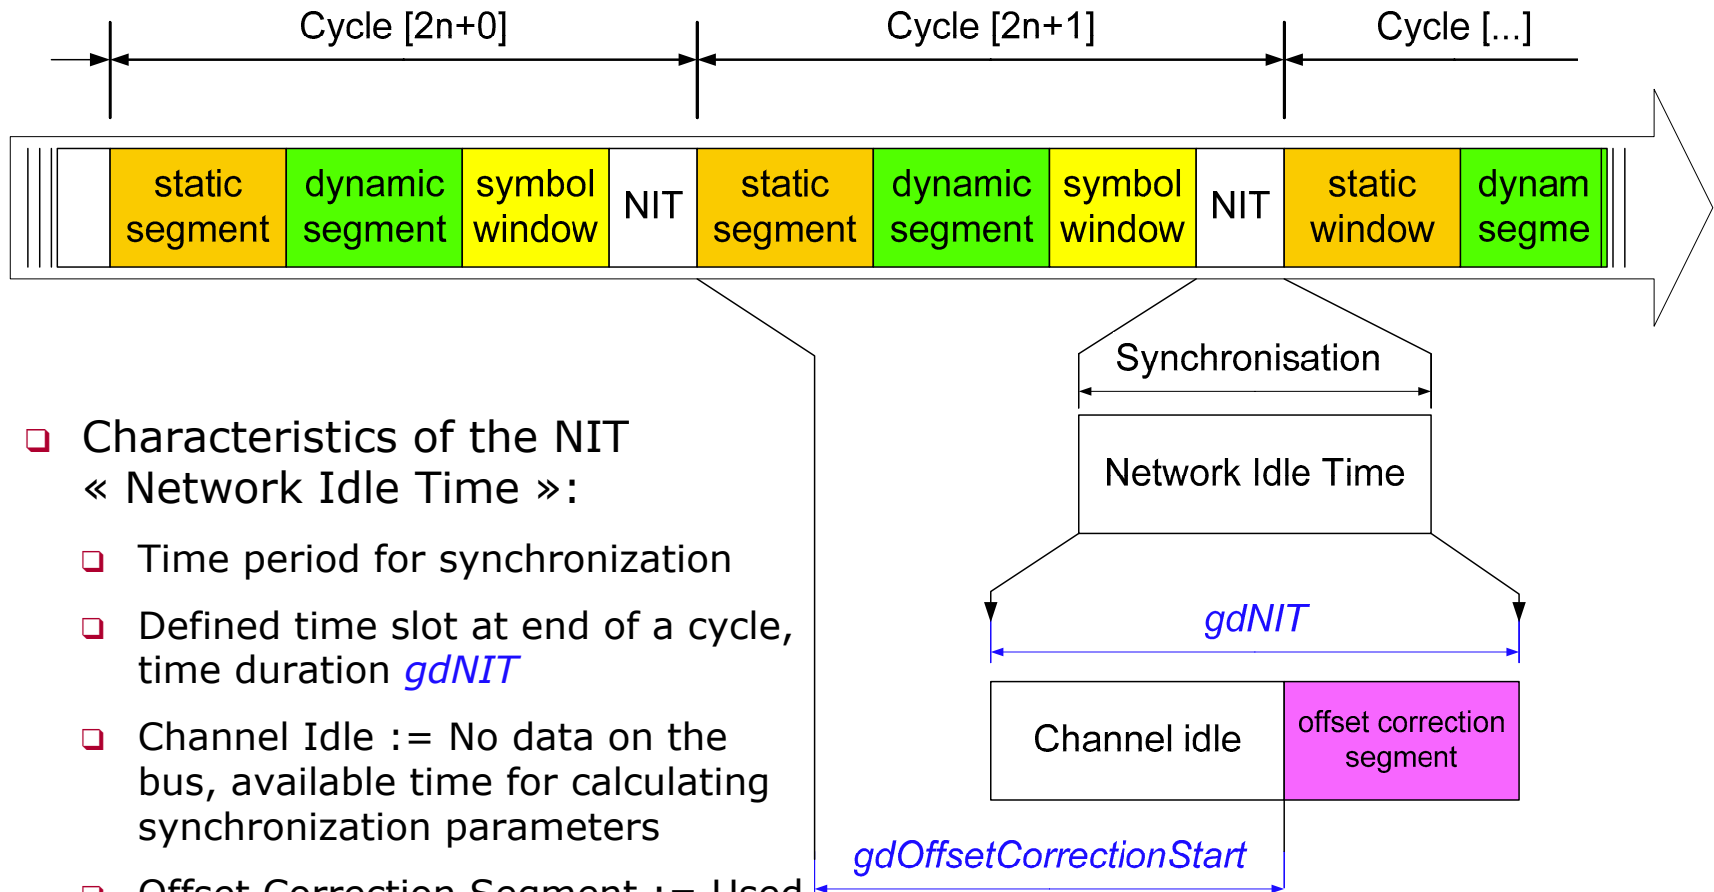

- ❑ Characteristics of the Symbol Window:
 - ❑ Optional
 - ❑ MTS := Media Access Test Symbol
 - ❑ Length is defined by $cdCAS := 30$
 - ❑ Test of the Bus Guardian
 - ❑ Only one symbol per cycle, therefore no arbitration
 - ❑ Possible to start transmission at Action Point, parameter $gdActionPointOffset$

FlexRay Communication Structure

NIT – Network Idle Time

- ❑ Characteristics of the NIT « Network Idle Time »:
 - ❑ Time period for synchronization
 - ❑ Defined time slot at end of a cycle, time duration *gdNIT*
 - ❑ Channel Idle := No data on the bus, available time for calculating synchronization parameters
 - ❑ Offset Correction Segment := Used for synchronization.

> **Startup**

- FIBEX Explorer
- PDU Support
- Analysis
- Stimulation

❑ State change:

- ❑ State before startup: All nodes are in Power-On and in Ready State (awake)
- ❑ State after startup: All nodes are Power-On and in Normal Active State
- ❑ « Creation of the common time base » for all nodes utilizing at least two Sync nodes

❑ Characteristics of the Startup:

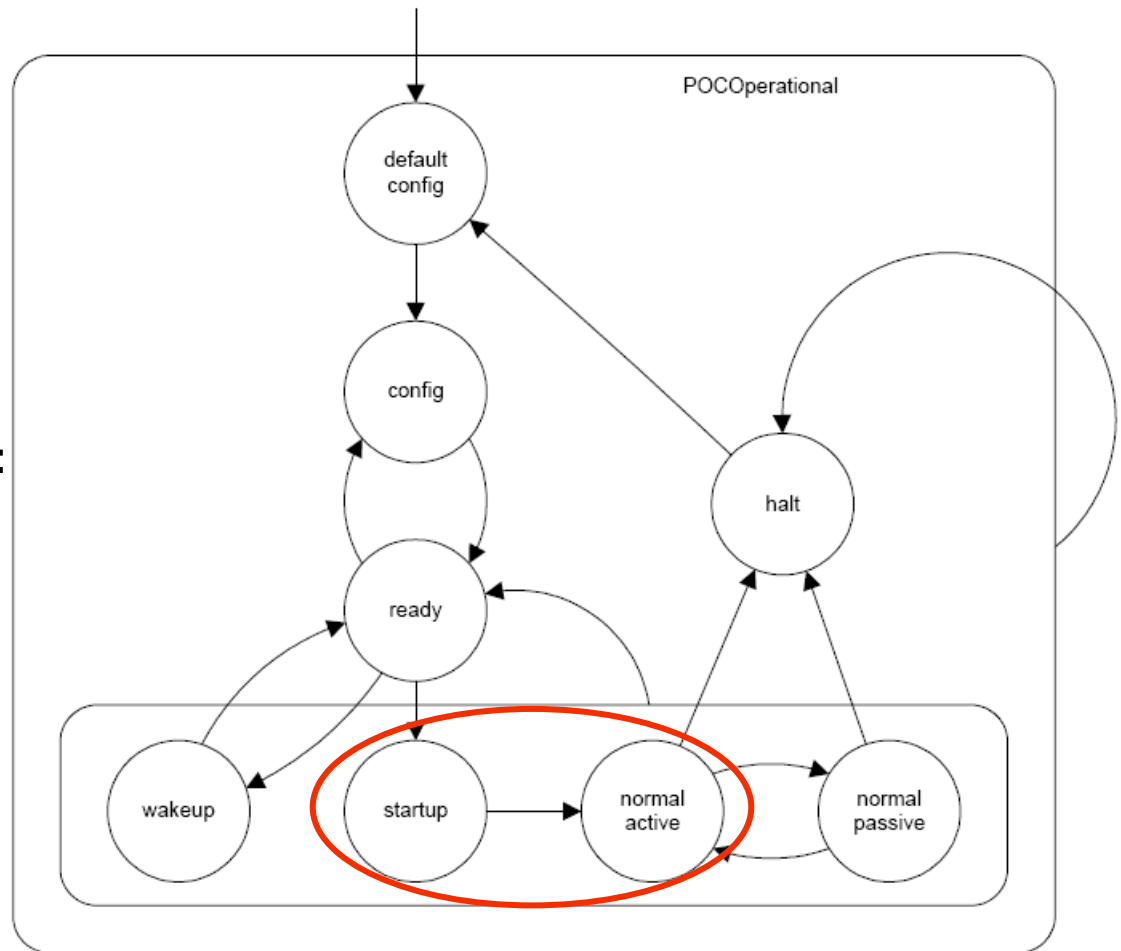

- ❑ At least two coldstart nodes are necessary
 - ❑ « Leading Coldstart Node » : Initiates setup, prescribes schedule
 - ❑ « Following Coldstart Node » : Synchronizes itself to Leading CSN
- ❑ Startup is simultaneously on both channels
- ❑ Leading Coldstart Node sends « CAS » Collision Avoidance Symbol
- ❑ After a specified time the Leading Coldstart Node sends its first Startup Frame (SyncFrame) -> Start of Cycle
- ❑ After a minimum of 4 cycles the Following Coldstart Node may also send its Sync Frames

❑ Leading ColdStart Node:

- ❑ Host puts CC in Startup
- ❑ POC goes to Coldstart Listen State
- ❑ CC sends CAS Symbol
- ❑ CC sends its Sync frames over 4 cycles

❑ Following ColdStart Node :

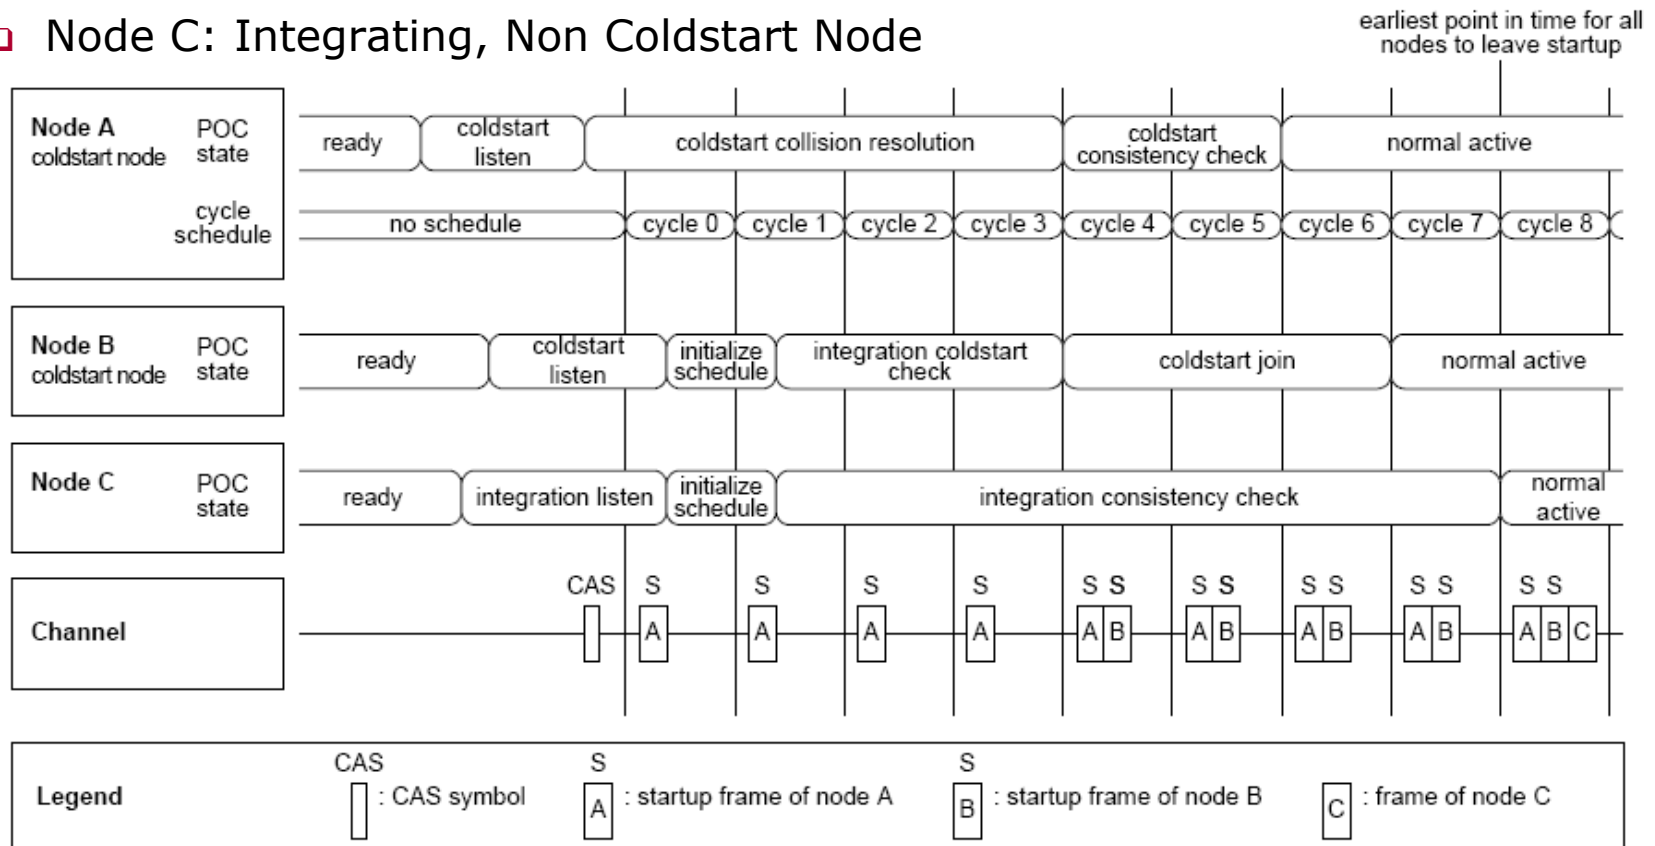

- ❑ CCs detect Sync frames
- ❑ Attempt to synchronize during the 4 cycles
- ❑ Send their own Sync frames for 5-7 cycles

Source: FlexRay PS2.1

Startup Example

- ❑ Node A: Leading Coldstart Node
- ❑ Node B: Following Coldstart Node
- ❑ Node C: Integrating, Non Coldstart Node

Source: FlexRay PS2.1

> **FIBEX Explorer**

- PDU Support
- Analysis
- Stimulation

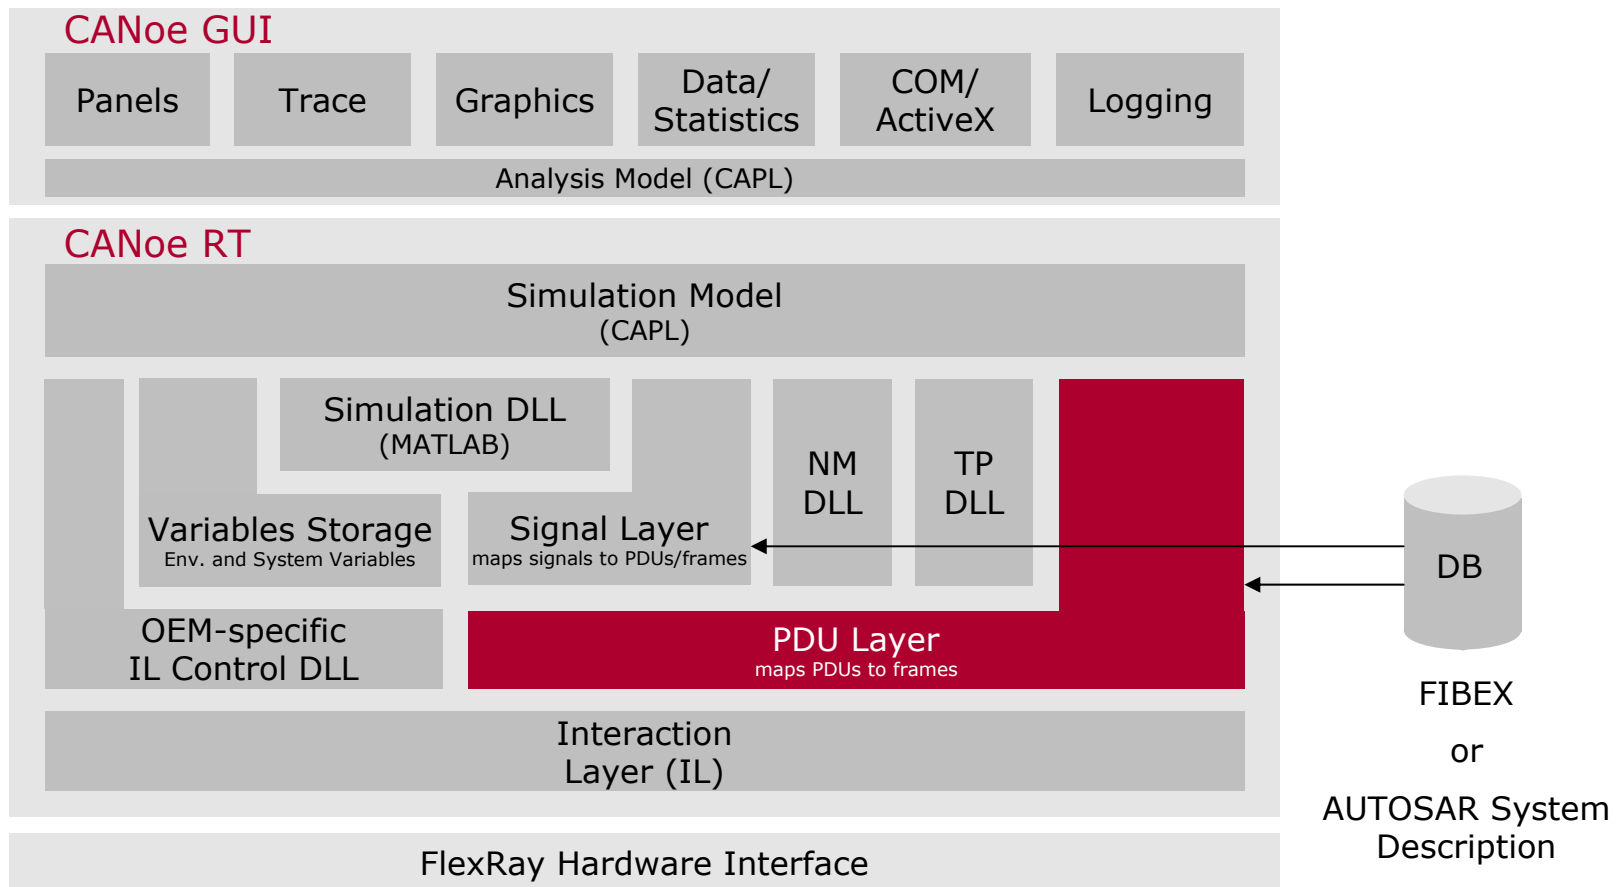

- ▶ User friendly visualization of FIBEX and FIBEX+ databases
- ▶ Detailed views for communication (Frames/PDUs, RX/TX relations, Signals, and ECUs), scheduling, and network parameters

PDU Support

CANoe's AUTOSAR Stack

- ▶ Semantic interpretation controlled by PDU Layer
- ▶ FIBEX or AUTOSAR System Description used as database

- ▶ Detailed analysis of the communication on network, node and frame level
- ▶ Automatic check based on the expected communication defined in the database
Example: The ECU **CANoe_Monitor** does not send the expected number of frames.

Select Measurement Channel **NEW 6.1** Reset Statistic Status **NEW 6.1**

DEZ

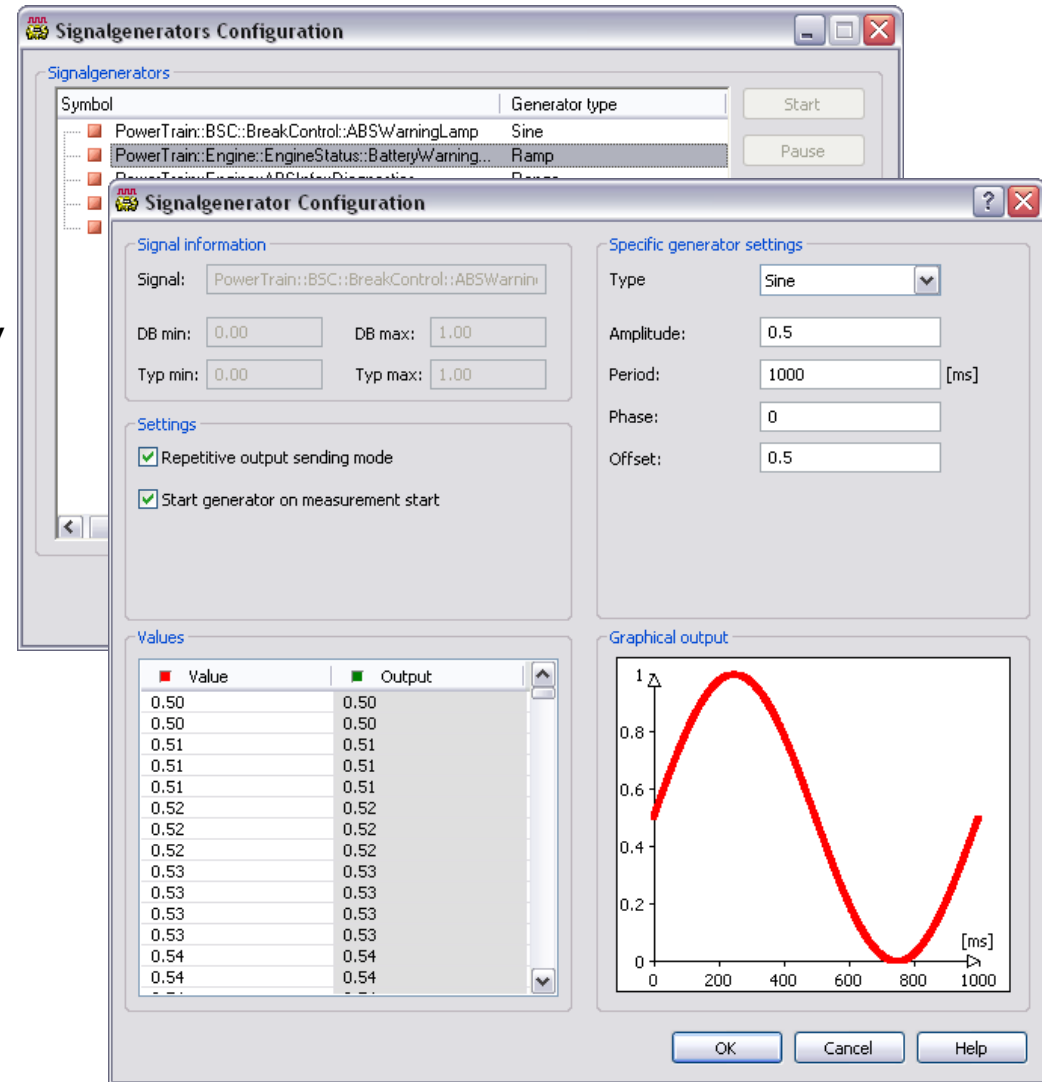

- ▶ Easy configuration of Tx PDUs considering all FlexRay PDU specific elements (Update Bit, Update Counter,...) using FIBEX 3.0 or FIBEX+
- ▶ Simplifies data update without any CAPL program code

- ▶ FlexRay Replay Block
 - ▶ Insertion of certain data sequence
 - ▶ Provides the counter part of a real ECU
 - ▶ Support of PDUs and Frames

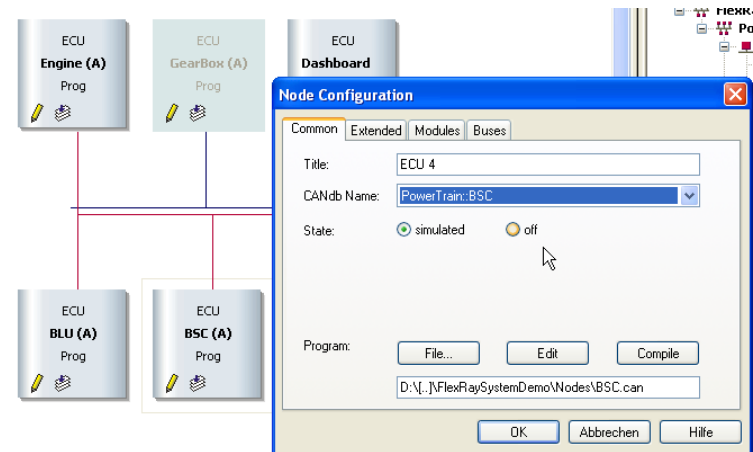

- ▶ Signal generator for FlexRay signals
- ▶ Simple generation of signal courses (ramp, sine, ...)
- ▶ Synchronized to the FlexRay schedule

Simulation Configuration

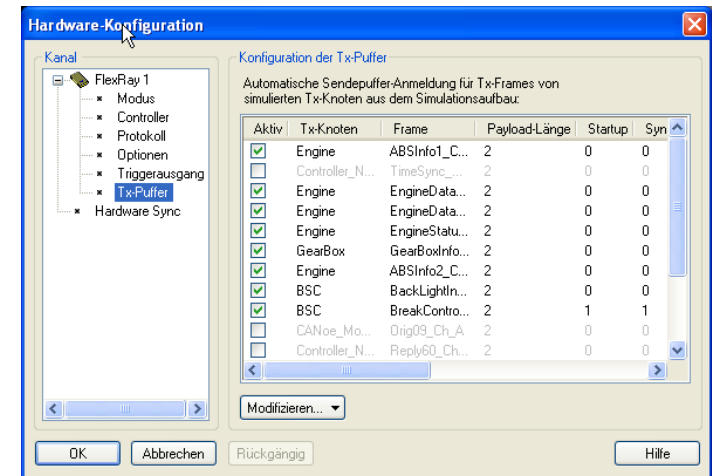

► Automatic registration of TX frames of simulated nodes

► Activation via ECU assignment in the simulation setup

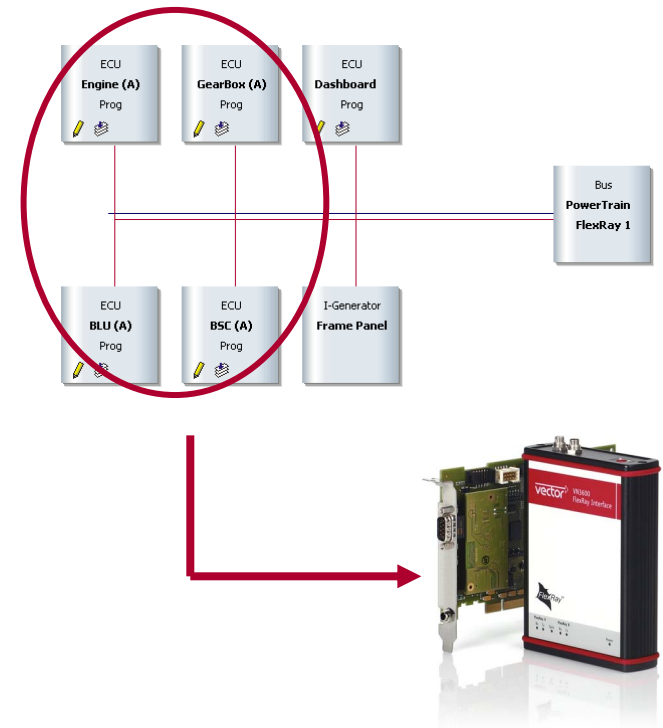

► Check and modification of the automatic registered TX frames

- > Additional manual deactivation of not needed TX frames to save TX buffers in the CC
- > One click modify of Startup/Sync flag for all frames
- ➔ Simply simulate complete load of static segment when using database import wizard with creation of simulation nodes!

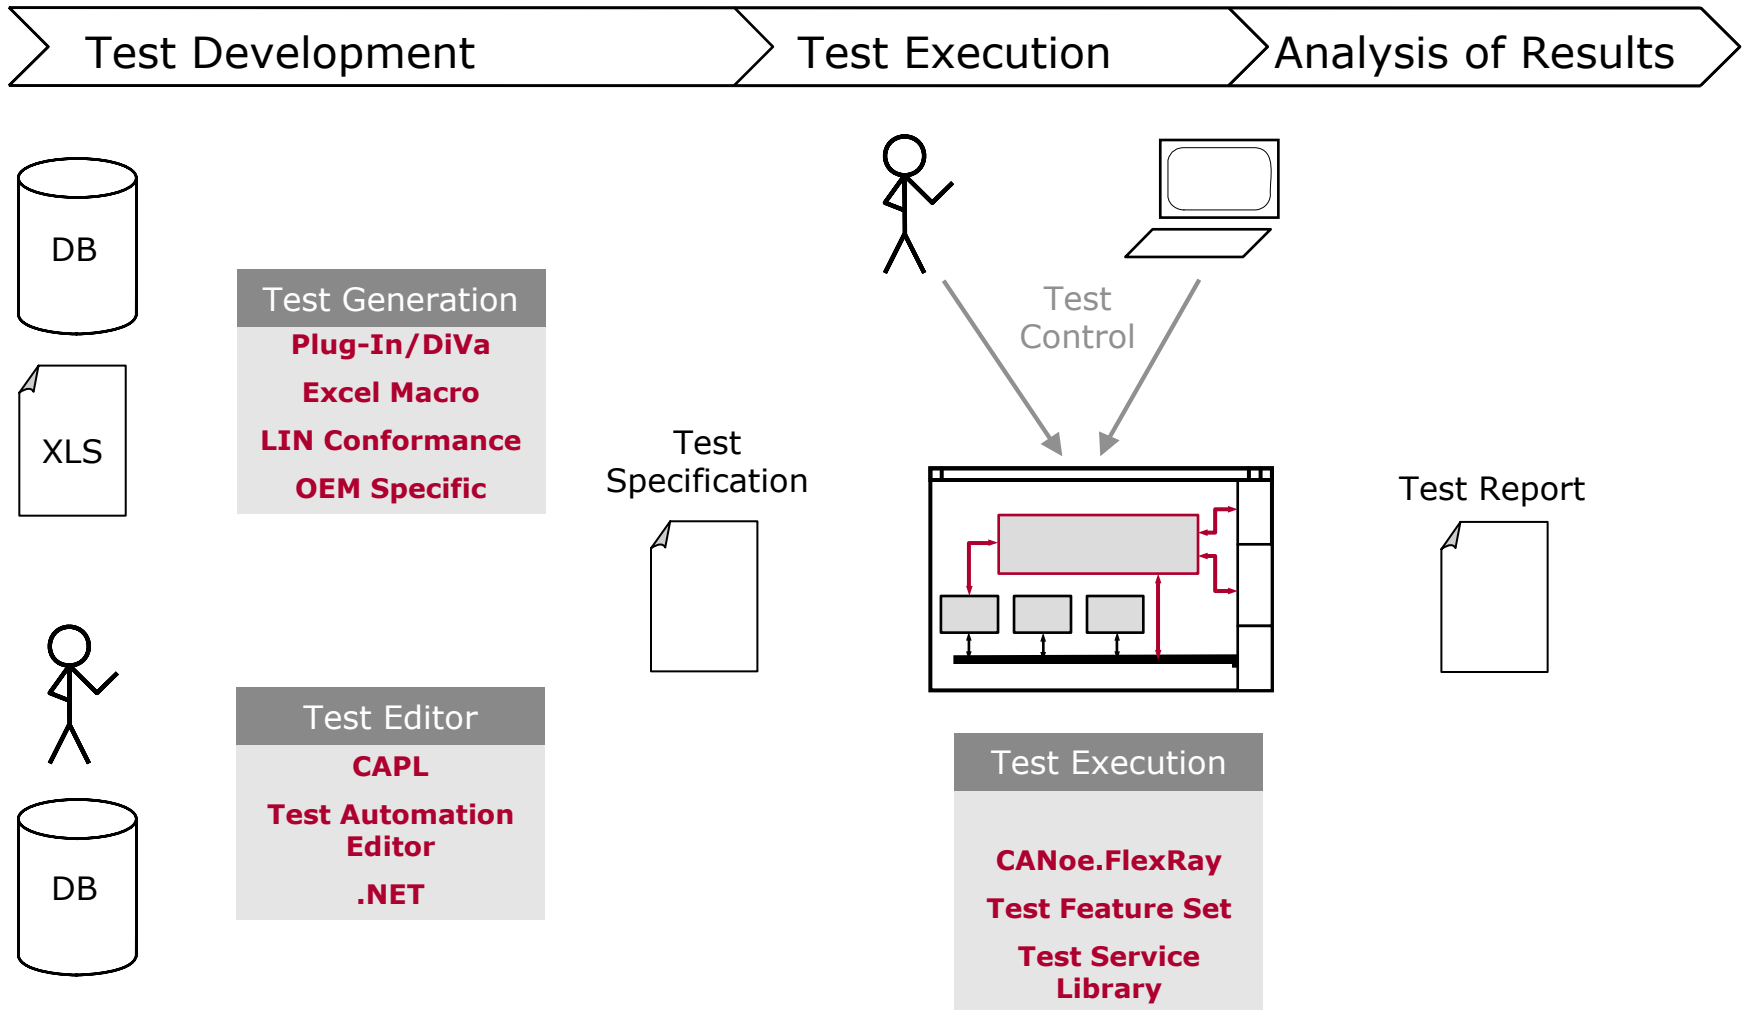

NEW 6.1

- ▶ Execution of CAPL programs on the VN3x00 & VN7600 network interfaces
- ▶ The CAPL code of the selected nodes will be transferred to the network interface during measurement preparation and executed on the modules
- ▶ Use case:
 - ▶ Simulation of time critical tasks
- ▶ Goal:
 - ▶ Deterministic execution of the CAPL programs
 - ▶ Reduced latency for fast responses

Destination Addr. : 1000								
Source Addr. : 5432								
TP Frame Type : Single TP Frame								
Data Length : 02								
000:7e 00								
133.244045	FR 1 A	(FlexRay TP data)		data	42	Tx	2	7e 00
133.244045	FR 1 A	Tester Present Send::pos	7E 00	pos	42	Tx	2	7e 00

Diagnostics over FlexRay

Diagnostics Console & Fault memory

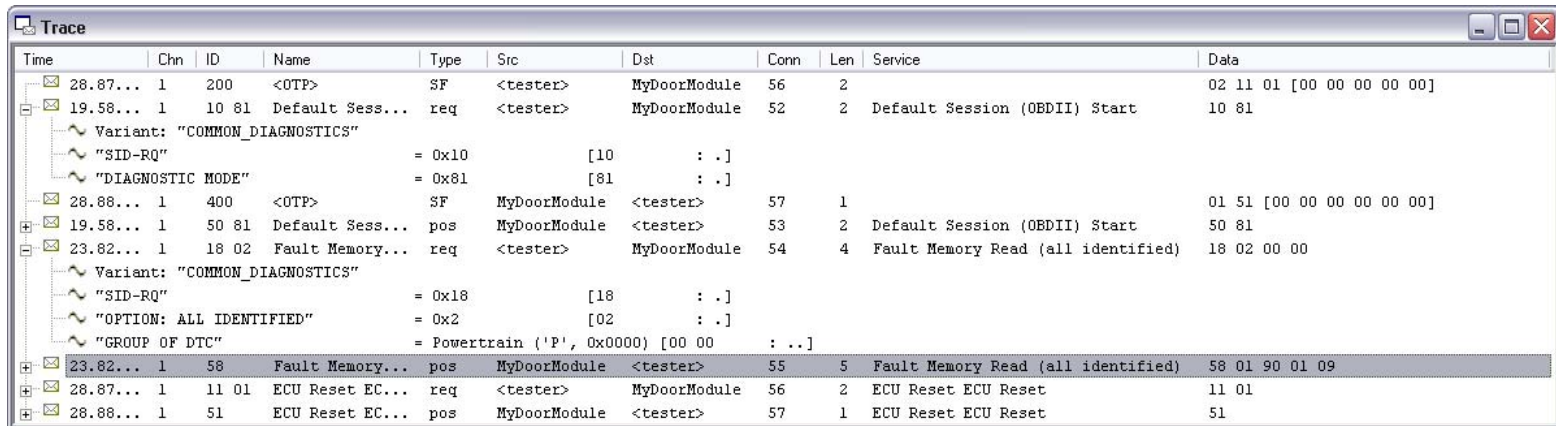

- ▶ Interactively browse & access available diagnostic services
- ▶ Cyclical update of fault memory contents / logging of DTCs for external processing
- ▶ One separate window per real / simulated network node
- ▶ No code development necessary
→ CDD/ODX file for ECU / network sufficient

Diagnostics over FlexRay

Diagnostic Observer & Symbolic Output

- ▶ Pure observer for monitoring diagnostic traffic on existing networks → no adverse influence on network
- ▶ Fallback option to KWP2000 generic interpretation → starting without specific diagnostic definition possible
- ▶ Symbolic presentation of traffic according to diagnostic description files → “speaking” service names & “meaningful” parameters
- ▶ Output to Trace, Graphics & Data windows
